Progress this week

This week I spent a few hours working on a schedule for this project. I made a Gantt chart that outlines estimated project times, when I expect to be able to work on each part of the project, and some deadlines for myself to complete certain tasks. Some of these dates may be subject to change, but this will depend on design and implementation. As mentioned before, this semester will largely be research to get background in working with the Linux kernel.

Due to a busy weekend, I was not able to dive into the kernel as I expected. I am still continuing to read papers on scheduler implementations, but a little behind this week.

Plan for coming week

I think before diving into the scheduler code, I will go through the write-your-own Linux OS course - especially the scheduler portion - just to get a grasp of what is required. This will help me get some foundation on what I will be working with.

Problems

No problems so far.

Long term plan: still OK?

Hopefully so!
